

What is GLOBAL WARMING?

Global warming is the process of increasing the average temperature of the earth's surface which occurs gradually and continuously.

What Triggers GLOBAL WARMING?

Global warming is caused by an increase in the concentration of greenhouse gases in the Earth's atmosphere, including -->

Burning Fossil Fuels

One of the main causes of global warming is the burning of fossil fuels, such as coal, oil and natural gas to produce energy. This process results in significant carbon dioxide (CO2) emissions into the atmosphere.

Deforestation

Extensive logging or deforestation also contributes to global warming. Forests absorb CO2 from the atmosphere as part of the natural carbon cycle. When forests are cut down, CO2 previously stored in trees is released into the atmosphere.

PLEASE KEEP THE EARTH

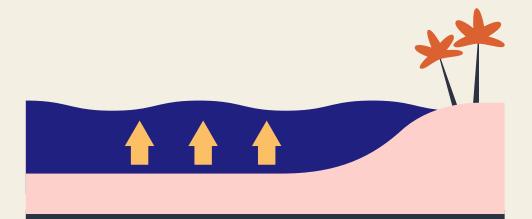

Natural Disasters:

Floods, Droughts, Landslides, Melting of Ice Sheets, etc.

Extreme Climate Change:

Heatwaves, Sea level rise, Damage to Marine Ecosystems, Climate Becomes Unstable, etc.

What impact Will it Have On Social And Economic issues?

Economic Loss

Public Health

Impact On Agriculture, Tourism and Other Sectors.

Threats to Public Heallth,
Increasing Unemployment Rates,
Declining Welfare and Public
Health.

Goping Efforts Global Warming:

There Are 5 Steps To Prevent GLOBAL WARMING:

Reducing the Use of Motor Vehicles,
Maintaining Nature Conservation,
Controlling Electricity Usage, and
Controlling Waste.

Reducing Carbon Footprint:

Education and Awareness:

Saving energy, Sustainable transportation and Recycling.

The importance of introducing global warming and deepening the knowledge of global warming.

BETTER WORLD FOR OUR FUTURE AND THOSE AROUND US.
